2 ABSTRACT

3 An accessory locking device for use in combination with a steel cable lock. The locking  
4 device is formed from a steel plate having an aperture and an L-shaped slot depending  
5 therefrom, the aperture is sized to receive the steel cable lock. The locking device further  
6 includes a flexible attachment cable having one end permanently attached to the steel plate and  
7 a distal end having an end fitting swaged thereto. The end fitting may be sized for insertion  
8 through the aperture and the flexible cable is sized for placement within the L-shaped slot of the  
9 steel plate. In operation, the distal end of the flexible attachment cable is wrapped around a  
10 diving accessory, such as a scuba tank, and the flexible cable is transversed into the L-shaped  
11 slot leaving the aperture available for the flexible steel cable lock to secure the locking plate,  
12 and the diving accessory, to a fixed object to prevent theft.
